## Overview

---

Amorphous solar panels are usually marketed as “thin-film” solar panels and are created in a different way than traditional solar cells. Manufacturers build them by depositing thin silicon layers directly onto a substrate, such as glass, metal, or plastic. Since these panels don’t have cells, they also do not require the same.

While not generally used in residential solar, amorphous solar panels come with their fair share of benefits. but, like any piece of technology, they also have some drawbacks. Here are a.

Typically, amorphous solar panels have an average efficiency of between 6% and 10% in terms of power generation. This is about a third of what you’d get from standard types. The efficiency rating refers to a panel’s ability to.

So, amorphous solar panels serve an important purpose in the grand scope of solar energy, but they aren’t designed for residential solar. so there.
