Christmas Island havells enviro

Overview

What is the impact of invasive species on Christmas Island?

“The big story for Christmas Island, in terms of human impacts to the natural environment, is the devastating impacts of invasive species since settlement being held responsible for the extinction of numerous endemic species,” Andrew says.

Does Christmas Island have a marine area?

The park includes a marine area where the terrestrial area of the park adjoins the sea. The marine area extends 50 metres beyond the low water line. The park's marine area covers approximately 2.1 square kilometres and the Territory of Christmas Island water extends 12 nautical miles from the island's shore.

What are the characteristics of Christmas Island's Ecosystems?

Characteristics of Christmas Island's ecosystems include a relatively high proportion of endemic terrestrial species, evolutionary isolation until relatively recent human arrival, native species that have evolved with few competitors, and many species with small population sizes.

What birds live on Christmas Island?

The threatened Abbot's booby and Christmas Island frigatebird have their only nesting habitat in the world on Christmas Island. There are also seven endemic land birds. The island is also important for other terrestrial fauna species. Of the six recorded native reptile species five are endemic, however these are in decline.

Will a decrease in rainfall affect Christmas Island National Park?

While future changes to rainfall patterns in Christmas Island National Park are uncertain, a decrease in annual average rainfall and an increase in air temperature and evaporation may impact many of the island's habitats and

species (Hyder 2008).

Why is Christmas Island a vulnerable coral reef?

The north coast of Christmas Island is especially vulnerable as its higher strata plate corals are more susceptible to wave damage than other corals. Increased wave action and storm surges associated with intense storms may reduce the ability of coral reefs to function as feeding and breeding grounds for fish, crab and turtle species.
