# How to generate electricity with such a small wind

## Overview

---

A wind turbine turns wind energy into electricity using the aerodynamic force from the rotor blades, which work like an airplane wing or helicopter rotor blade. How does a small wind energy system work?

The key feature of a small wind energy system is the wind turbine. The turbine uses the energy of motion (kinetic energy) from the wind to turn a shaft, thus making mechanical energy. This shaft is attached to a generator. The resulting spin within the generator makes electricity. A wind turbine thus operates the opposite way of a fan.

How does a wind turbine generate electricity?

Wind is created by the unequal heating of Earth's surface by the sun. Wind turbines convert the kinetic energy in wind into clean electricity. When the wind spins the wind turbine's blades, a rotor captures the kinetic energy of the wind and converts it into rotary motion to drive the generator.

How do wind turbines convert kinetic energy into electricity?

Wind turbines convert wind's kinetic energy into mechanical power. This mechanical power can then be converted into electricity through the use of a generator. The kinetic energy of the wind is collected by the blades on the wind turbines. Similar to the wings on an aircraft, the wind flows over the airfoil-shaped blades causing lift.

How does wind energy work?

Wind turbines work by capturing the energy of moving air with blades, converting it into rotational motion, and ultimately into electricity. What are the environmental benefits of wind energy?

Wind energy is clean and produces no greenhouse gases, making it an eco-friendly alternative to fossil fuels.

How do humans use wind energy?

Humans use this wind flow, or motion energy, for many purposes: sailing, flying a kite, and even generating electricity. The terms "wind energy" and "wind power" both describe the process by which the wind is used to generate mechanical power or electricity.

How much power does a wind energy system produce?

The size of a turbine and the speed of the wind determine how much electricity (power) a wind energy system will produce. A small wind energy system has a power output as much as 100 kilowatts. A 100-kilowatt turbine operating in a sufficiently windy location (on average 12MPH) can produce enough electricity over a year for 20 typical homes.
