Indonesia sae renewables

Overview

Will Indonesia see a boom in renewables?

Indonesia has not yet seen a boom in renewables, resulting in fossil fuels meeting its electricity demand growth. The National Energy Policy (NEP) 2014 set a target of 23% of renewables in the energy mix by 2025, however, this target is likely to be reduced to between 17-19% in the revised NEP currently being developed.

Does Indonesia need more solar energy?

Renewable energy in Indonesia has stagnated for the past seven years. In 2023, it attracted a mere US\$.5 billion, lagging far behind its Southeast Asian neighbors. Indonesia needs to attract US\$146 billion in near-term renewable energy investment to meet the country's 2030 climate target. Current policies and onerous contractual requirements towards solar.

Should Indonesia invest in renewables in 2025?

The overall conclusion is that, from a system integration perspective, Indonesia can aim for higher shares of renewables than those listed in the current plans for 2025 and beyond, especially when considering a mix of variable renewables and other dispatchable technologies.

Does Indonesia have a power sector boom?

Coal use in the electricity sector in the past ten years has nearly doubled, contributing to a sharp rise in overall power sector emissions, totalling 86 million tonnes of CO₂ (MtCO₂) from 2013 to 2023, mainly from coal. Indonesia has not yet seen a boom in renewables, resulting in fossil fuels meeting its electricity demand growth.

Is solar PV a viable alternative to fossil fuels in Indonesia?

On the cost side, the picture is more nuanced. Solar PV brings fuel savings from both fossil fuels (5.5-7%) and biomass (which comes at a premium) but

the current regulations in Indonesia do not allow solar PV to compete in the short term when considering the total system cost. However, the authorities have options.
