# Microgrid Demonstration Project 28

Standard 20ft containers

Standard 40ft containers

## Overview

---

The main building block of the laboratory includes MG main resources such as:

1. RES-based microgeneration and grid-coupling devices. The laboratory includes 15.5 kWp of PV installed capacity and a 3 kW micro-wind turbine (WT) emulator, represented in Fig. 15.7b, c, respectively. The RES-based MS can be.

The laboratory supervision and automation are carried out by a SCADA system, which supports all the laboratory operations and ensures the electrical.

The laboratory infrastructure will allow the individual development and test of microgeneration power electronic interfaces with new control strategies and integrated testing.

The first layer of the MG control consists of local controllers: the MC, EV VC, energy storage unit controller, and LC. Considering the resources available in the laboratory, the following controllers were considered: 1. Energy.

Why is a microgrid demonstration project important?

The construction of the microgrid demonstration project is not only an important attempt by State Grid Aksu Power Supply Company in power grid technology innovation, but also an important measure to promote regional economic and social development and improve people's livelihood.

What is the CERTS microgrid project?

Following a series of distributed energy resources and efficiency measures installed at the Jail, it is also often referred to as the Green Jail. The microgrid project aims to demonstrate the first commercial implementation of the CERTS microgrid technology, using a large-scale battery, new and legacy renewable energy sources, and a fuel cell.

What is Microgrid technology?

Microgrids are the most effective application form of integrated energy. The coordinated optimization of multiple energy sources such as electricity, gas,

and heat in a local area is the basis for comprehensive energy development. Microgrid technologies, coupled with Internet technologies, can realize the development of regional “energy Internets”.

Should microgrid demonstration programs be based on a single goal?

Considering all the efficiency and on-site generation and storage investments made over a decade, this target was met. In general, organizing demonstration programs in this way, around a single uniform goal, will not illicit the best projects. Rather projects should be evaluated on microgrid success at meeting its local requirements.

What role will microgrids play in the future power grid?

As an important part of the smart grid of the future, microgrids will play an important role in the future power grid by taking advantage of its strengths such as accommodation of diversification of energy forms, flexibility of grid connection interfaces, customization of power quality, and bi-directional energy information flow.

Is a microgrid possible?

The PrInCE Lab microgrid project demonstrated that is possible to realize a microgrid by adopting components and equipment originally developed for classical distribution network applications. However, the adoption of these components made their integration into a microgrid structure more complex than the expected.
