# New invention of wind power generation

## Overview

---

**Makani Airborne Wind Turbine:** The Makani Airborne Wind Turbine (AWT) can access stronger and more consistent wind at altitudes near 1,000 feet, which means that 85% of the US could have viable wind resources using the device (compared to just 15% using current turbine technology). The Makani turbine could.

**Wind Harvester:** The new Wind Harvester is based on a reciprocating motion that uses horizontal aerofoils similar to those used on aeroplanes. It is virtually noise-free and can generate.

**Windstalk:** Within each hollow pole is a stack of piezoelectric ceramic discs. Between the ceramic disks are electrodes. Every other electrode is.

**Windspire:** The standard Windspire is 30-feet tall and 4-feet wide, designed to come in under the typical 35-foot height restrictions of local municipalities. Due to the vertical axis design.

**Wind Lens:** Japanese researchers say that they've discovered a simple way to make wind turbines up to three times as efficient. By placing a 'wind lens'.
