

Solar Energy South Africa

Niger alergy systems

Overview

What is Niger's energy system?

As shown in figure 2, the most striking feature of Niger's energy system is the dominance of biomass. This represents 79% of total consumption and meets 83% of household energy needs. Biomass in the form of fuelwood, charcoal and agricultural residues is used in inefficient cooking appliances.

Does Niger have a dual energy system?

Like all ECOWAS countries, Niger has a dual energy system containing co-existing traditional and modernised energy systems and practices. On the one hand, traditional biomass fuels and inefficient technologies dominate household energy needs. On the other, electricity and more refined fuels are also used in Niger as well as up-to-date appliances.

Are there any off-grid solar energy systems in Niger?

There is considerable experience of off-grid PV electrification, water pumping and solar water heating systems in Niger. Each of these will be explored below. The main decentralised renewable energy system being promoted in Niger for rural electricity is solar PV.

Why is access to energy a problem in Niger?

Despite this rich potential, access to energy is still a challenge for the authorities. Final energy consumption in Niger is estimated at 0.15 toe per capita, one of the lowest in the world. The weakness of this value is mainly due to limited access of Niger's households to modern energy.

How can Niger improve energy access?

Broadening energy access is a central national development objective in Niger. At present, less than 25% of the population enjoys access to electricity, and the picture in rural areas is bleaker, at less than 5% electricity access. Generation of electricity through renewables has long been viewed as an

important way to close this gap.

What is Niger's energy mix?

Mainly used for electricity generation and transport, petroleum products account for 18% of Niger's energy mix. Their share of the total has increased in recent years. Mineral coal for electricity generation accounts for the remaining balance at 3% of total energy supplies in Niger.
