The United States Minor Outlying Islands is a statistical designation defined by the International Organization for Standardization's ISO 3166-1 code. The entry code is ISO 3166-2:UM. The minor outlying islands and groups of islands comprise eight United States insular areas in the Pacific Ocean (Baker Island, Howland Island, Jarvis Island, Johnston Atoll, Kingman Reef, Midway Atoll, Palmyra Atoll, and Wake Island) and one in the Caribbean Sea (Navassa Island). Though scattered across the Pacific and relatively small, the islands are rich in history and nature and have been strategically important. The nearly barren Howland is famous for being the island renowned American pilot Amelia Earhart intended to land on before she vanished during her round-the-world flight in 1937. Wake, home to a now extinct flightless bird, was the site of a pitched World War II battle in 1941, and was an essential stopover for aircraft transiting the Pacific in the mid-20th century. Likewise, Midway Atoll is home to many corals and birds and was also the center of a famous battle of WW2, which helped turn the tide of the Pacific War. Other islands are rich in unique biodiversity, such as Palmyra, the site of a WW2 base. Johnston Atoll was a famous island for its Cold War base, when it was expanded and used to destroy chemical weapon stockpiles; it was also the site of a nuclear accident. Johnston was heavily modified with land expansion, while others are nearly untouched nature reserves.

The ORC system, developed in collaboration with Calnetix Technologies, uses extremely low temperature heat sources to generate electrical power, such as the waste heat of the main engine jacket cooling water, which is converted to produce electricity for shipboard consumption.

Terrapin Geothermics is leading the way in North America with heat conversion projects that deploy ORC technology. We're uniquely positioned to help you get the most out of an Organic Rankine Cycle system. Contact us today to put our expertise to work for you.
