Photovoltaic module panel transfer standard

Overview

IEC 62548:2016 sets out design requirements for photovoltaic (PV) arrays including DC array wiring, electrical protection devices, switching and earthing provisions. Can phase change materials be used in photovoltaic (PV) modules for thermal regulation?

In recent years, the utilization of phase change materials (PCMs) in photovoltaic (PV) module for thermal regulation has attracted wide attention in this field, as the hybrid PV-PCM technology can not only achieve higher photoelectric conversion efficiency but also make it possible to extract thermal energy stored in PCMs for cascade utilization.

What are the methods of energy transfer from PV module to surroundings?

The methods of energy transfer from PV module to surroundings and power productivity were theoretically modeled which involved: long and short wave radiation, heat loss due to convection over the panel front surface and solar energy transformed into electricity.

What is a photovoltaic module?

photovoltaic module is a framed or unframed assembly of solar PV cells designed to generate DC power. A photovoltaic module consists of: • the framing material (where applicable). The scope shall correspond to photovoltaic modules produced for use in PV systems for electricity generation.

What standards are available for the energy rating of PV modules?

Standards available for the energy rating of PV modules in different climatic conditions, but degradation rate and operational lifetime need additional scientific and standardisation work (no specific standard at present). Standard available to define an overall efficiency according to a weighted combination of efficiencies.

Does PV module operating temperature affect power output?

The computational fluid dynamic study of the PV module coupled with PCM is carried out in which essential heat transfer mechanisms between PV module to PCM and environment have been accounted for. Additionally, its effect on power output has been investigated to see the variation of PV module operating temperature.

Is PV panel coupled with phase change materials a feasible solution?

PV panel coupled with phase change materials (PCM) could be a feasible solution due to the higher energy storage density of such materials. However, heat transfer studies of PCM combined with PV panel are quite intricate due to variable ambient conditions and changing thermo-physical property of the material with phase change.
