Uganda inaccess power factors

Overview

What percentage of Ugandans have access to electricity?

Both grid and off-grid connections account for 42% of access to electricity in Uganda. The term grid connection refers to access to power through the national electricity grid. The Uganda National Household Survey 2019/2020 states that the Ugandan electricity grid reaches 18.9 % of Ugandans, mainly in urban areas.

Why does Uganda's Electricity Supply fluctuate?

Fig. 4 shows that 92% of Uganda's electricity supply is from Hydro power and the rest is supplied from Bagasse (4%), Solar PV (2%), and Thermal (1%). This implies that any issues with water resources, such as drought or flooding, could trigger electricity supply fluctuations in the country.

Does inequality affect electricity access in Uganda's slums?

But inequality is also deeply embedded in electricity access, in the existing energy systems, energy policies and energy practices, and thus far, few studies have investigated these in Uganda's slums.

What are the energy injustices in Uganda's slums?

The energy injustices in Uganda's slums manifest mostly as the inadequate access to electricity services despite the settlements' close proximity to the grid and surplus power generation, and the negative implications of this access gap on people's well-being and livelihoods.

Does Uganda have a 'household electrification rate'?

It is noted that Uganda reports access to electricity as “household electrification rate” and considers individuals who are directly connected to either grid or off-grid. However, challenges to electricity access remain unresolved.

Why does Uganda have a power crisis?

About 15 years ago, Uganda experienced a power crisis, with electricity demand exceeding the available supply by a 2-to-1 ratio due to delayed capacity additions and low water levels in Lake Victoria (RMI, 2020). Today the country generates a surplus of electricity.
