# Where to connect the switch of wind power generation

## Overview

---

How do wind turbines work?

Wind turbines can turn the power of wind into the electricity we all use to power our homes and businesses. They can be stand-alone, supplying just one or a very small number of homes or businesses, or they can be clustered to form part of a wind farm. Here we explain how they work and why they are important to the future of energy.

How do you connect a wind turbine to an inverter?

Trenches need to be dug for the electrical cables which run from the turbine to the control unit and inverter. Depending on the turbine size, this may require use of a crane. An electrical engineer or electrician will connect the wind turbines DC output to the control box and then the inverter.

What are special requirements for wind generation?

To insert wind power generation into the power system without affecting power quality or system stability, special requirements for wind generation were introduced. These requirements come in two forms: those established by system operators and national or international standards.

How DFIG control a wind turbine?

DFIGs provide only primary control for frequency, but majority of control is provided by the conventional power plants. Using power electronic converters, kinetic energy stored inside the variable speed wind turbine (VSWT) is used for inertial control, pitch control and speed control.

How do wind generators control the frequency of a power system?

As the wind energy penetration increases, the power system's (grid) frequency gets affected. Wind generators participate in the control of frequency control through advancements in technology. Verma and Kumar developed a load frequency control strategy for a two area interconnected

power system based on DFIG.

How can we maximise on excess wind energy?

There are a number of ways that we can maximise on excess wind energy: In order for homes and businesses to use cleaner, greener energy, more renewables – such as wind power and solar power – will need to be connected to the electricity grid.
