Wind power is the use of wind energy to generate useful work. Historically, wind power was used by sails, windmills and windpumps, but today it is mostly used to generate electricity. This article deals only with wind power for electricity generation. Today, wind power is generated almost completely with wind turbines.

Wind is air movement in the Earth's atmosphere. In a unit of time, say 1 second, the volume of air that had passed an area  $A$  is  $A v$ . If the air density is  $\rho$ .

**Growth trends**In 2020, wind supplied almost 1600 of electricity, which was over 5% of worldwide electrical generation and about 2% of energy consumption. With over 100 added during 2020, mostly , global installed wind.

Onshore wind is an inexpensive source of electric power, cheaper than coal plants and new gas plants. According to , wind turbines reached (the point at which the cost of wind power matches traditional sources) in some areas of Europe in.

The from wind power is minor when compared to that of . Wind turbines have some of the lowest : far less than.

A wind farm is a group of in the same location. A large wind farm may consist of several hundred individual wind turbines distributed over an extended area. The land between the turbines may be used for agricultural or other purposes. A wind farm may also be.

Small-scale wind power is the name given to wind generation systems with the capacity to produce up to 50 kW of electrical power. Isolated communities, that may otherwise rely on generators, may use wind turbines as an alternative. Individuals.

Central governmentAlthough wind turbines with fixed bases are a mature technology and new installations are generally no longer subsidized, floating wind turbines are a relatively new technology so some governments subsidize.

A wind farm or wind park, also called a wind power station or wind power

plant, is a group of in the same location used . Wind farms vary in size from a small number of turbines to several hundred wind turbines covering an extensive area. Wind farms can be either onshore or .

What is wind power?

Wind power is the use of wind energy to generate useful work. Historically, wind power was used by sails, windmills and windpumps, but today it is mostly used to generate electricity. This article deals only with wind power for electricity generation.

How many people work in wind power?

Jobs include the manufacturing of wind turbines and the construction process, which includes transporting, installing, and then maintaining the turbines. An estimated 1.25 million people were employed in wind power in 2020. A small Quietrevolution QR5 Gorlov type vertical axis wind turbine on the roof of Bristol Beacon in Bristol, England.

What is a wind turbine installation?

A wind turbine installation consists of the necessary systems needed to capture the wind's energy, point the turbine into the wind, convert mechanical rotation into electrical power, and other systems to start, stop, and control the turbine.

How does a wind turbine turn mechanical power into electricity?

This mechanical power can be used for specific tasks (such as grinding grain or pumping water) or a generator can convert this mechanical power into electricity. A wind turbine turns wind energy into electricity using the aerodynamic force from the rotor blades, which work like an airplane wing or helicopter rotor blade.

Where are wind turbines installed?

Wind turbines are typically installed in windy locations. In the image, wind power generators in Spain, near an Osborne bull. Wind power is variable, and during low wind periods, it may need to be replaced by other power sources.

How do humans use wind energy?

Humans use this wind flow, or motion energy, for many purposes: sailing, flying a kite, and even generating electricity. The terms "wind energy" and "wind power" both describe the process by which the wind is used to generate mechanical power or electricity.
